

# Software Toolkit

---

The 'Software Toolkit' represents a set of utilities required to build and run your projects.

Provides the following functionality to the projects:

- Versioning: defining the project version parameters from one central place
- Installation and build recipes
- Dependency providing: project can pull required dependencies and install it.
- Multiple Git upstreams support (for example, GitHub and BitBucket at the same time)
- Project testing interaction
- Project opening support with advanced feature (pre-opening recipes, etc.)
- Desktop icon launching support

## What is included?

- The [Versionable](#) module
- The [Installable](#) module
- The [Dependable](#) module
- The [Upstreamable](#) module
- The [Testable](#) module
- The [Project](#) module
- The [Iconic](#) module

## How to install?

Execute the following:

```
(test -e ./clone || wget "https://raw.githubusercontent.com/red-elf/Software-Toolkit/main/clone?append=$((($(date +%s%N)/1000000)) -0 clone) && \
  chmod +x ./clone && ./clone git@github.com:red-elf/Software-Toolkit.git
./Toolkit
```

or via one of the mirror repositories:

- [GitFlic](#):

```
(test -e ./clone || \
  wget "https://raw.githubusercontent.com/red-elf/Software-Toolkit/main/clone?append=$((($(date +%s%N)/1000000)) -0 clone) && \
  chmod +x ./clone && ./clone git@gitflic.ru:red-elf/software-toolkit.git
./Toolkit
```

- [Gitee](#):

```
(test -e ./clone || wget "https://raw.githubusercontent.com/red-elf/Software-Toolkit/main/clone?append=$((($(date +%s%N)/1000000)) -0 clone) && \
    chmod +x ./clone && ./clone git@gitee.com:Kvetch_Godspeed_b073/Software-Toolkit.git ./Toolkit
```

*Note:* It is required to execute the script from empty directory where you wish to clone the Software-Toolkit utility.
